"Amino acid sequence of a mouse myeloma immunoglobin heavy chain (MOPC 47 A) with a 100-residue deletion.";

-1- MISCELLANEOUS: THIS ALPHA CHAIN WAS ISOLATED FROM A MYELOMA PROTEIN THAT CONTAINS ONE LIGHT AND ONE HEAVY CHAIN PER MOLECULE, LINKED BY A DISULFIDE BOND. IN CONTRAST, NORMAL MOUSE IGA MOLECULES CONTAIN TWO LIGHT AND TWO HEAVY CHAINS AND LACK A LIGHT-HEAVY CHAIN DISULFIDE BOND.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                        Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                seq

The proteins can also be used for the production of antibodies which be used to assay for zonulin in body tissue or fluids, or in affinity purification of zonulin. The present sequence represents an N-terminal
                                          New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                      Zonulin; antagonist; zonula occludens toxin receptor; human; blood-brain barrier; antiinflammatory; gastrointestinal inflammation; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes pure zonulin which has an apparent molecular weight of 47 kD, as determined by SDS-PAGE, which is recognised by both anti-tau polyclonal antibody and by anti-zonula occludens toxin (ZOT) polyclonal antibody, and is capable of reversibly opening mammalian tight junctions. Zonulin proteins function as physiological modulators of mammalian tight junctions. They can be used for enhancing the absorption of therapeutic agents across tight junctions of intestinal and nasal mucosa and across tight junctions of the blood brain barrier. Zonulin can be used with agents such as drugs,

lymphocyte activation. Purceive to inhibit lymphocyte activation by blocking delivery to inhibit lymphocyte activation. Purceive the products are useful for inhibit lymphocyte activation by blocking delivery to limphocyte activation by blocking delivery to l
                                                                                                                                                                                                      The invention relates to a method of regulating lymphocyte activation by selectively binding multiple cell surface (mcs) antigens expressed the same lymphocyte. The method and the products are used to regulate lymphocyte activation. Lymphocytes can be incubated with immobilized ligands or Ab's or their fragments specific for the target Ag's in ord to achieve Ag aggregation in vitro. The multispecific molecules that contain multiple binding specificities in a single soluble molecule are
                                                                                                                                especially useful in aggregating multiple Ag's in vivo resulting in lymphocyte activation. Multispecific molecules may also be constructed to inhibit lymphocyte activation by blocking delivery of activation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of the N-terminal region of adult human brain zonulin. The N-terminal sequences of human adult and foetal zonulins (see Y79130-36) were compared with Vibrio cholerae zonula occludens toxin (ZOT) to identify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for treatment of conditions associated with breakdown of the blood-brain
                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim

ROBSULT ROBULT IN ROBUST ROBUS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
Best Local :
The recombinant enzyme was produced by cloning the gene encoding it from a C. thermohydrosulphuricum genomic library and using it to express the enzyme in a host cell e.g. E.coli which is easier to cultivate and has less complex nutritional requirements than C. thermohydrosulphuricum ( which is an obligate anaerobic thermophilic organism). The enzyme is used to hydrolyse starch, amylase or pullulan, opt. in conjunction with a glucogenic or maltogenic enzyme. It has an optimum temp. range of 80-85 deg.C, i.e. 5 deg. lower than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Expanded T and/or B cells are used in adoptive immunotherapy of cancer and infectious diseases such as AIDS. Aggregation of multiple surface receptors or inhibition of lymphocyte activation is not only limited to treatment of, e.g. immunodeficiency, infectious diseases and cancer and can also be applied for a wider variety of treatments such as for suppression of autoimmunity, hypersensitivity, vascular disease and transplant rejection. Also, stimulation of human T cells with immobilized Ab's specific for three T cell surface Ag's results in enhanced proliferation when compared with stimulation by two immobilized Ab's. Sequences Y41165-73 represent Llama Whh polypeptide unique hybrid sequences, Y41174-79 represent Llama Whh complete sequences and Y41180-85
                                                                                                                                                                                                                                                                                       Claim
                                                                                                                                                                                                                                                                                                                                      Heat stable enzyme with both alpha-amylase and pullulanase activities - prepd. by expressing Clostridum thermohydrosulphuricum DNA in host cells, useful in hydrolysis of starch, etc.

The method and the products are used to regulate lymphocyte activation. Lymphocytes can be incubated with immobilized ligands or Ab's or their fragments specific for the target Ag's in orde to achieve Ag aggregation in vitro. The multispecific molecules that contain multiple binding specificities in a single soluble molecule are especially useful in aggregating multiple Ag's in vivo resulting in lymphocyte activation. Multispecific molecules may also be constructed to inhibit lymphocyte activation by blocking delivery of activation signals to the cells. The methods and the products are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   that of the native enzyme, least 10 differently sized activities were produced, c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            B cell response; immune enhancement; immunosuppression; immunotherapy; cancer; infectious disease; multiple surface receptor; AIDS; hypersensitivity; vascular disease; transplant rejection; Vhh protein.
                            and infectious diseases such as AIDS. Aggregation of multiple surface receptors or inhibition of lymphocyte activation is not only limited treatment of, e.g. immunodeficiency, infectious diseases and cancer ar can also be applied for a wider variety of treatments such as for
                                                                                                                                      Expanded T and/or B cells are used in adoptive immunotherapy of cancer
                                                                                                                                                             regulation of T and B cell responses in vivo and in vitro. The activation of signals may result in either immune enhancement or immunosuppression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 43; Fig 16A; 114pp;

Also, stimulation of human T cells with immobilized Ab's specific for three T cell surface Ag's results in enhanced proliferation when compared with stimulation by two immobilized Ab's. Sequences Y41165-73 represent Llama Whh polypeptide unique hybrid sequences, Y41174-79 represent Llama Whh complete sequences and Y41180-85 represent Llama constant region sequences.

The T84.12 antibody is directed against the tumour marker carcinoma embryonic antigen, and is useful for tumour imaging and immunotherapy.

The amino acid sequence given in the specification has been incorrectly identified as a nucleic acid sequence, therefore unacceptable characters have been represented as an 'N'. The amino acid sequence given below has been derived from the cDNA, by the indexer.

The present sequence represents a human heavy chain antibody, from an scfv antibody insign phage library, produced by a method as described above. The antibodies produced can be used for diagnostic and therapeutic applications and for isolating tumour antibodies have low immunogenicity in humans compared to murine monoclonal antibodies (MAbs). Since the antibodies are isolated from fusion phage libraries, their affinity and specificity for a tumour cell line can be improved by genetic manipulations.
                                                                                                                                                                                                                                                                    Query Match

The invention relates to a method of regulating lymphocyte activation CC by selectively binding multiple cell surface (mcs) antigens expressed by Ct the same lymphocyte. The method and the products are used to regulate CC lymphocyte activation. Lymphocytes can be incubated with immobilized CC ligands or Ab's or their fragments specific for the target Ag's in order CC expecially useful in aggregation in vitro. The multispecific molecules that CC contain multiple binding specificities in a single soluble molecule are CC expecially useful in aggregating multiple Ag's in vivo resulting in CC lymphocyte activation. Multispecific molecules may also be constructed to inhibit lymphocyte activation by blocking delivery of activation CC signals to the cells. The methods and the products are useful for regulation of T and B cell responses in vivo and in vitro. The activation of signals may result in either immune enhancement or immunosuppression. Expanded T and/or B cells are used in adoptive immunotherapy of cancer CC and infectious diseases such as AIDS. Aggregation of multiple surface conceptors or inhibition of lymphocyte activation is not only limited to treatment of, e.g. immunodeficiency, infectious diseases and cancer and CC suppression of autoimmunity, hypersensitivity, vascular disease and CC and also be applied for a wider variety of treatments such as for CC sequences Y41165-73 represent Llama vhh polypeptide unique hybrid CC represent llama constant region sequences.

                                                                                                                                                                            DNA molecules from Gram positive bacterium, corresponding to dnaE

C (231001), dnaX (231002), and dnaB (231003). The POIC, dnaN and dnaG genes

C (231004-231006) are also identified. The dnaE gene corresponds to the

C alpha subunit of the Escherichia coli, DNA polymerase III holoenzyme,

C dnaX corresponds to the gamma and tau subunits, and dnaB corresponds to

C the helicase. The alpha subunit is the actual DNA polymerase, the gamma

CC complex forms the clamp loader and tau is a "glue protein". DnaX encodes

CD both gamma and Tau, Tau is the product of the full gene, while gamma is

CC the product of the first two thirds of the gene. The DNA sequences of the

CC replication by acting on various parts of the gram positive bacterial DNA

CC replication by acting on various parts of the gram positive bacterial DNA

CC colymerase holoenzyme. The products and methods of the invention can be

CC used for identifying pharmacological agents or lead compounds for agents

CC active at the level of a replication protein function, particularly DNA

CC replication. The agents identified can be used as antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 10

                                                                                                                                                                                                                                                                                      This sequence represents the replicative helicase, dnaB, of Staphylococcus aureus strain WCUH 29 (NCIMB 40771). The sequence Was deduced from an isolated polynucleotide (see X87985) and shows Structural homology to other proteins of the replicative helicase C family. The invention provides dnaB polynucleotides and polypeptides, and methods for producing such polypeptides by recombinant techniques. Also provided are methods for utilising C dnaB polypeptides to screen for antibacterial compounds, especially C those that target antibiotic-resistant strains. The polypeptides C and polynucleotides may be employed as research reagents for the C discovery of treatments and diagnostics, particularly for human C discases. The polypeptides can be used to produce antibodies, of Hese are used to prevent, inhibit or treat diseases, particularly C of Helicobacter pylori infections, such as gastrointestinal can also be used to treat wounds and in-dwelling devices to prevent c bacterial adhesion and infection, and to block dnaB protein-mediated mammalian coll invasion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Local Similarity
